Week 9 Error Finding

Konrad Sikorski

1. Line 1 - `<php` is missing the ?. It should be `<?php`

2. Line 2 - connect.php needs quotes and there's no semicolon. It should be `require('connect.php');`

3. Line 3 - one / isn't a comment, it needs two. It should be `//`

4. Line 5 - `$Name` should be `$name` because PHP is case sensitive, and it's missing a) at the end. It should be `if (isset($name))`

5. Line 7 - the quotes around Client Table are the wrong kind. Since the table name has a space it needs backticks: `` `Client Table` ``

6. Line 8 - missing a semicolon at the end of the line.

7. Line 9 - `mysql_num_rows` should be `mysqli_num_rows` to match mysqli_query.

8. Line 10 - one = sets the value, it doesn't compare. It should be ==

9. Line 12 - name is missing the $. It should be `echo $name;`

10. Line 14 - the first if statement never gets closed. Need to add a } before ?>

Fixed code:

```
<?php
require('connect.php');
// This code has 10 errors. Find and fix them.
$name = $_POST['name'];
if (isset($name))
{
$sql = "SELECT * FROM `Client Table` WHERE Name='$name' ";
$result = mysqli_query($con, $sql);
$rows = mysqli_num_rows($result);
if($rows == 1)
{
echo $name;
}
}
?>
```
